Note: The process of protocolling and preauthorization of exams prior to scheduling ensures that the studies are appropriate and are properly scheduled. Once confirmed, schedulers reach out to patients to find the best time. This contributes to longer lead times in the scheduling process, but ultimately shorter wait times for appointments by eliminating the need for rescheduling or obtaining new authorizations for studies that were incorrectly ordered. This data set represents outpatients scheduled for routine studies. Stat and urgent studies are accommodated same day.

Of note, for the first two weeks of June, emergency department and inpatient CT scans accounted for 58% of the total volume for CT with 42% accounted for outpatient scans
